

Natlang Code book

Based on a true story

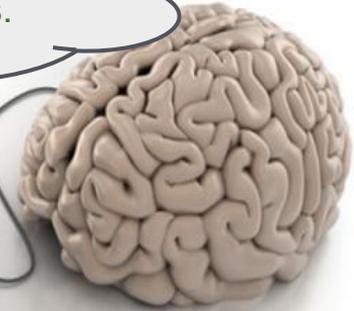

by Ramtin M. Seraj
Spring 2015

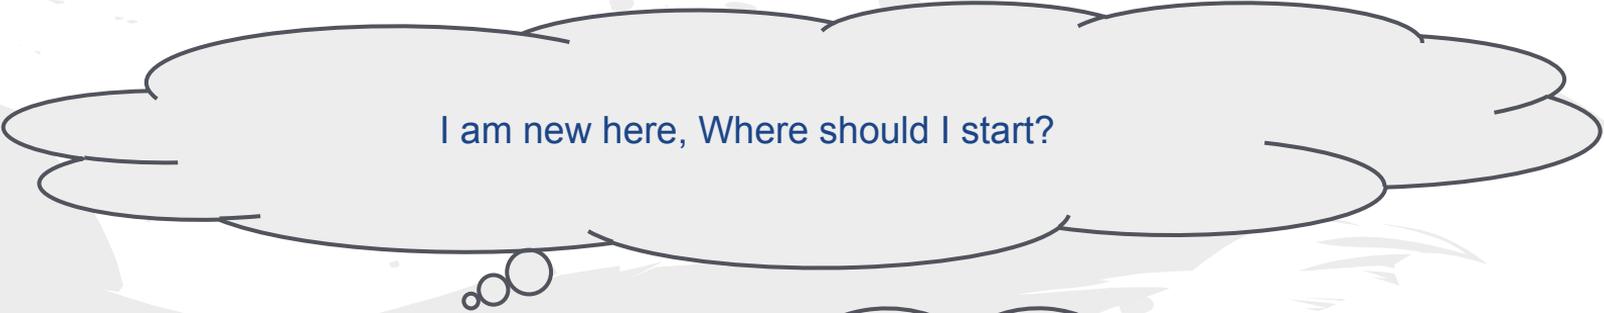

Natural Natural Language Processor

I have many questions in my mind? Who can answer It ?

Right now I am reading all texts available on the internet, I can answer all of your questions.

I am new here, Where should I start?

I found a [todo list](#) on the web for you.

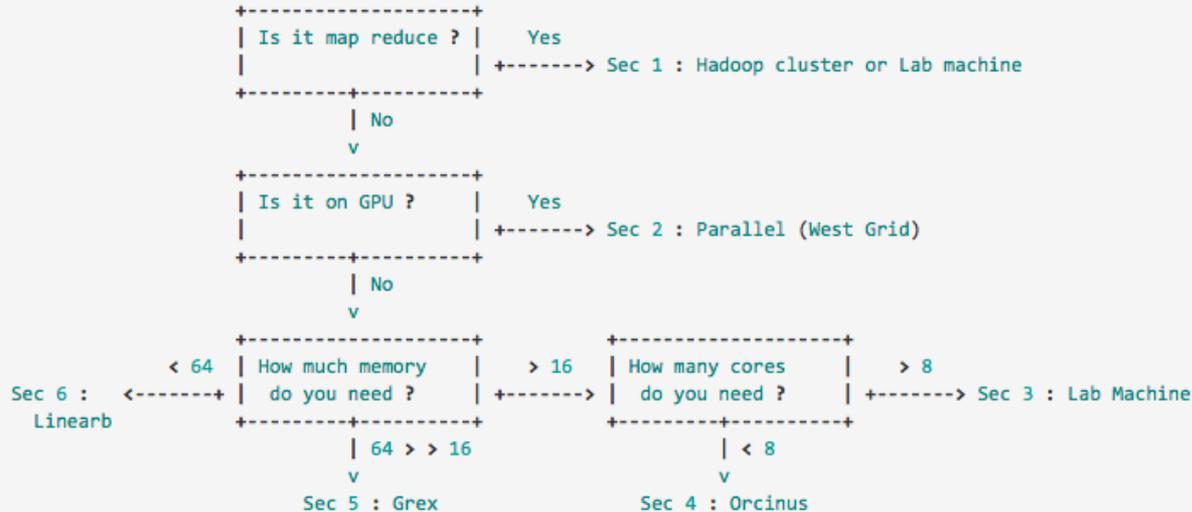

But you need to have a bitbucket account before access it.

After creating your account send a message to Anoop to set your permissions.

Where should I run my codes ?

How many resources do you need ?

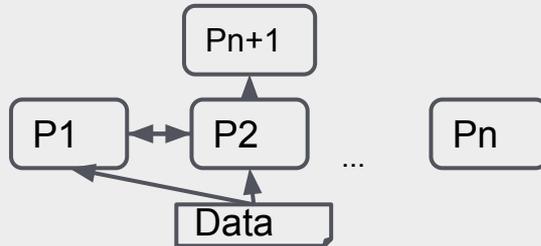

more info : https://bitbucket.org/sfu-natlang/natlang-wiki/wiki/running_jobs

Where should I run my codes ?

Scaling up :

If you want many process in your application to run parallel ->HPC clusters are for you.

Sample codes

HPC

Hadoop

Hadoop is useful when you want to run your similar operation on a huge amount of data independently.

GPU is great for situations that you are doing a certain operation on different inputs. e.g. Operations on matrices.

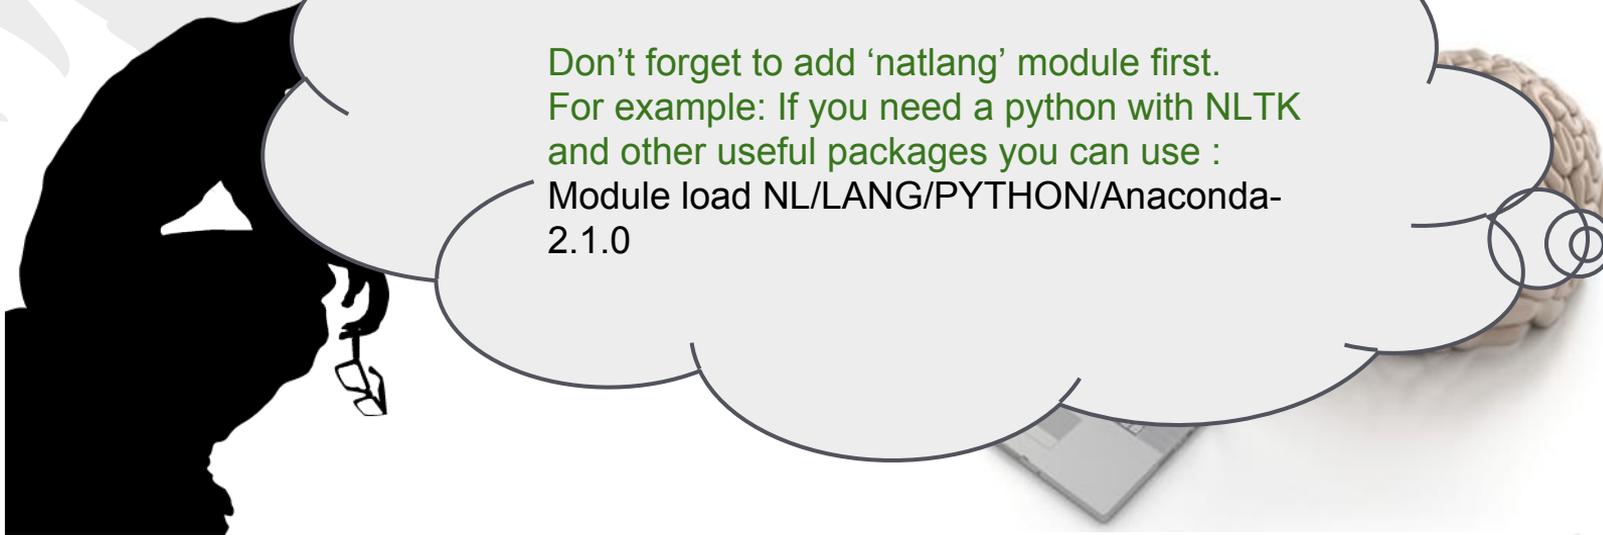

I want to use a software on my lab machine but I can't install it !

Most of software you might need are available in modules, which means they compiled before for your system and you can add/remove them using 'module load'. here is the complete tutorial : ['Modules'](#)
If your module is not available, you have two options :

Ask lab admin

Install by yourself. → [Help](#)

I can't find the module needed for NLP !

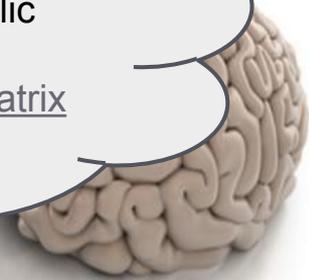

Don't forget to add 'natlang' module first.
For example: If you need a python with NLTK
and other useful packages you can use :
Module load NL/LANG/PYTHON/Anaconda-
2.1.0

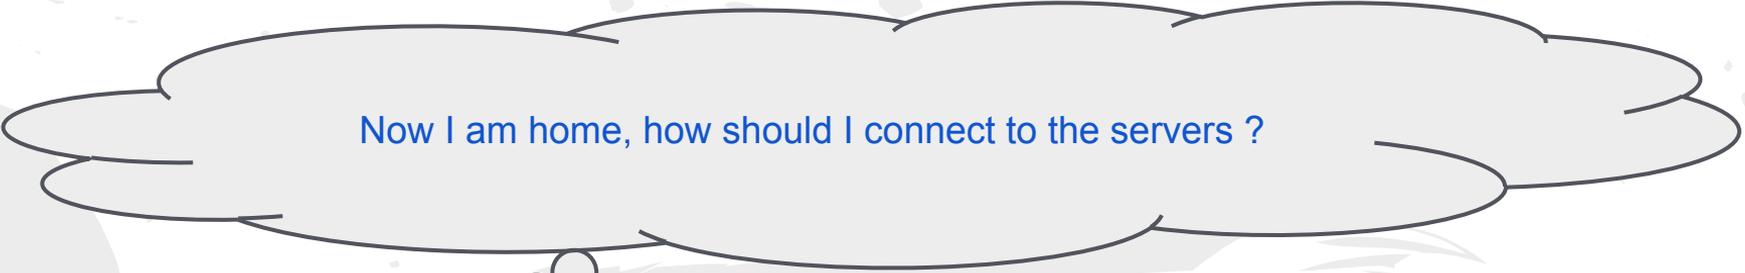

Where to store and find data ?

Data Catalog

Most of our data is in natlang-data,
Highly recommended to use symbolic
links to read these data

For MT peoples we have NatlangMatrix

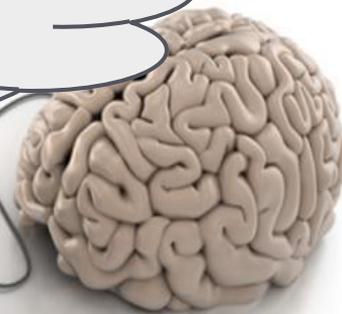

Now I am home, how should I connect to the servers ?

For accessing computers inside university you have to first connect to one of three linux console servers.
see [here](#)

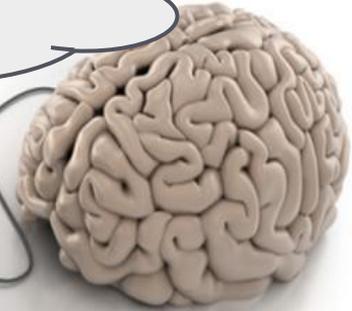

Now I have some results, where should I write my papers?

We keep our papers on private repository like Bitbucket.
Our old publications are there which also contain some useful features, you can fork them.

I am feeling alone, I want to talk to people about my research when I am not in the lab?

You can talk to lab members about different topics on Slack. There are several streams for different uses.

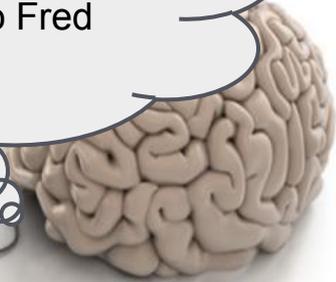

It seems that I am not the only person facing these problems, Is there a more efficient way to find these things ?

Natlang Wiki
includes informations about
Computing Resources,
Programming tips, Applications
informations, ...
Search in the repository

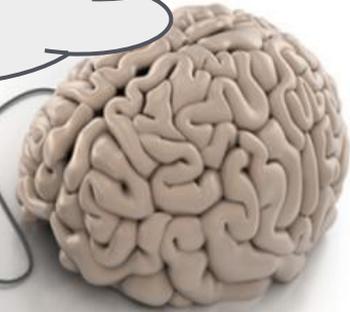

So if you can answer all of my questions, then why I should work any more ?

Server Error : The server encountered an internal error and unable to complete your request. Please report this issue to Fred or Anoop.

I am graduating ...

Wait a minute ... are you sure?
graduation guide.

Before you leave , Do you know
we have a photo shoot next week
!

Any Question

This is one of reasons we are still working ...
Most of them are wrong
